

KING'S PATENT WASHING APPARATUS

Is without doubt the greatest labor-saving machine ever invented; an apparatus occupying a space of four feet square will wash 120 pieces of Clothing in five minutes, without injuring the finest fabric. We have washed clothes for over a hundred families in this city, who will certify not only that it does not injure the clothing, but that they will wear much longer than when washed by the old process of rubbing. The principles upon which it operates is very simple—a child can manage it. It consists of a revolving boiler placed over a furnace; this boiler is half filled with suds and the other half with dirty clothes; the fire in the furnace creates a steam in the boiler, which, by revolving, the clothes are first carried into the steam and then into the suds. The price of the apparatus for family use, is from \$35 to \$50. Large apparatus for foundries and hotels, from \$100 to \$300. We shall keep an apparatus at our place of business, ready for operation at all times so that parties can see it tested before purchasing.
