

THE SENTINEL

ROCKVILLE, MD. FRIDAY, SEPTEMBER 14, 1860

National Democratic Nominations. FOR PRESIDENT, JOHN C. BRECKINRIDGE, OF KENTUCKY. FOR VICE PRESIDENT, Gen. JOSEPH LANE, OF OREGON.

For the State at Large. E. LOUIS LOWE, of Frederick county; J. LLOYD MARTIN, of Talbot county.

For the Districts. ELIAS GRISWOLD, of Dorchester Co.; J. BROOKS BOYLE, of Carroll Co.; JOSHUA VANSANT, of Baltimore City; T. PARKIN SMYTH, of Baltimore City; JOHN RITCHIE, of Frederick Co.; JAS. A. FRANKLIN, of Annapolis Co.

THE DAWN OF DAY.—A month ago almost every person was ready to concede the election of Lincoln. The division of the Democratic party temporarily paralyzed the energies and depressed the hopes of the conservatives of the country. But there has been a great reaction. The union movement throughout the country has so far revived confidence that the canvass now wears a very different face from what it did in the first moments of depression and alarm.

BRITISH AND NEWSPAPERS.—The meeting of the Democracy of St. Mary's county, announced for the purpose of placing in nomination for President and Vice Presidency, Judge Tansy and Mr. Nelson, was held at Rockville on Saturday last, the 1st inst. (George W. Morgan, Esq., was elected President. Dr. Thomas J. Stone, Vice President, and Robert C. Combs, Secretary, at the meeting. Mr. Harris, Wm. Floyd and Dr. A. Nesbitt were appointed a committee to report resolutions. The committee reported a series of resolutions, in which, after stating the distracted condition of the country and the divisions in the Democratic party, recommended that Messrs. Breckinridge and Lane should be withdrawn, and the party concentrate upon Judge Tansy and Judge Nelson. Mr. G. Harris, Geo. C. Morgan and Vernon Dorsey, Esq., were appointed a committee to carry out the objects of the meeting.

THE VOTE OF MARYLAND.—The New York Day Book estimates the following as the vote of this State in the Presidential election in November next. We do not know where the observations were made, but our own observation was not putting it down as a very fair and reasonable estimate: Breckinridge, 42,000; Lane, 32,000; Fremont, 6,000; Lincoln, 6,000.

THE PATRIOTISM.—In Massachusetts a black man, a recent arrival, can vote after one year's residence with a German or Irishman, or any other European, making seven years in all. Yet Carl Shurz is "starving" in the West for the party which makes this distinction between the African and the German, between the negro and the Irishman.

MR. SEWARD'S "EXCELLENT FRIEND."—Mr. Seward, in his speech at Kalamazoo, Michigan, on being received there last Saturday, said prophetically, but kindly, of the candidates in the field, the only man who, in any possible case, and after every combination cannot be elected, is my excellent friend, Stephen A. Douglas. Every vote given for him in the North is a vote given for Breckinridge, and every vote given for him in the South is given for Bell or Lincoln. It sounds rather oddly to hear Seward, the great "irrepressible conflict" exponent, call any Democrat his "excellent friend," but we presume the relations which established this friendship between Seward and Douglas arose out of their association in opposition to the administration of President Taylor, when it is reported that Mr. Seward had "checked his baggage through" the Black Republican party. The great political division then existed between Mr. Seward and Mr. Douglas, and it is not surprising that the record should continue, since both are still acting harmoniously together in endeavoring to secure the election of Lincoln.

THE NEW YORK FLOOD.—The Committee representing the Breckinridge and Douglas Parties in New York, came to an agreement on Saturday afternoon, by which the Douglas men are to give the Breckinridge men ten names on the electoral list, and the Breckinridge men are to withdraw James T. Brady, their candidate for Governor, and elect Mr. Kelly, the candidate of the Douglas Party. In consideration of this, the Douglas men are to name candidates for Lieutenant-Governor and State Commissioner in place of those now on the Douglas ticket. These are the terms offered by the Breckinridge Party, and agreed to by the sub-committee appointed by the Douglas State Committee to negotiate a union. All the required to constitute the bargain is an endorsement by the Douglas General Committee.

THE PLANTERS' ADVOCATE (MA) learns from a correspondent in Anne Arundel that there was quite a stir among the dealers in that county on Saturday night, the 23rd ultimo. There were five slaves and two free negroes, but the latter were not taken into account on Sunday lodged in Annapolis jail. There were a number of other slaves who were to have gone off if this first attempt had been successful. It is said that the person who arrested these negroes has in his possession information of interest to all slaveholders, which he will communicate to any one who will call on him, but, from professional motives, it is deemed best not to make public.

THE BOARD OF DIRECTORS OF THE Chesapeake and Potomac Canal, on Thursday, and reconsidered their late action in relation to the navigation of the canal. It is reported that the Board has decided to allow steam-propelled draught not greater than 12 feet to navigate the canal, at a speed not exceeding four miles per hour, by using the one rate of toll as now charged on freight boats, and complying with the regulations which govern all other craft on the line.

THE DOUGLASSIAN.—The Richmond Enquirer announces that this gentleman is detained at home principally by the ill health of a member of the family. His own health, however, has not been good during the summer, and he is constantly engaged in superintending the enclosure, ditching, clearing and planting of the plantation, which he has purchased and settled on during the past few months, and which must be attended to at once to prevent serious loss. He is now even writing a suitable house for the residence of his family during the winter.

THE DOUGLASSIAN.—There is a lamentable drought in Kansas, owing to the want of rain during the past summer. In certain parts of the Territory, indeed, there is said to have been no rain of two hours duration for more than a year. Efforts are being made at Chicago to collect funds to meet the immediate wants of the suffering inhabitants of the Territory.

ACCIDENT TO EX-PRESIDENT PIERCE.—As Gen. Pierce was riding in a buggy on Thursday, Concord, N. H., his horse took fright at a load of barrels and turned a corner, throwing him out. He was stunned for a few moments, and slightly bruised in the face, though not seriously.

THE MARKETS

Wheat—The market is quiet, and prices are steady at 1.25 to 1.35 for fair do. Corn—The market is quiet, and prices are steady at 50 to 60 for fair do. Flour—The market is quiet, and prices are steady at 1.00 to 1.10 for fair do.

Commissioner's Notice. THE Commissioners for Montgomery county will meet on TUESDAY, the 25th inst., when they will act upon the report of the Examiners on the road petitioned for by Nicholas J. Adams, and also road running through the lands of U. Z. Munster and others, and upon the petition of John T. Veirs and others, for a road and bridge from Edwards Ferry to the Potomac River.

The whole to bear interest from the day of sale. The sale to be made at 12 o'clock, P. M. THOMAS HILLARY, Executor. 500 BUSHELS OF PRIME TIMOTHY SEED, JUST RECEIVED, and for sale, low, by WM. B. DORSEY & CO., No. 118 High St., Georgetown, D. C. sep 14-17

Proposals for Building Bridge.

SEALED PROPOSALS will be received at this office until Tuesday, the 19th of October, for building a bridge, 210 feet long, over Middlebrook Creek, on the Georgetown and Frederick Road, agreeably to the following specifications: to wit: Two abutments, 18 feet long each at the bottom, sloping to 16 feet at the top; 9 feet high from low water mark; 5 feet thick at bottom, sloping to 4 feet at the top; 4 wing walls, two on each side, measuring 45 feet each in length; 2 feet thick at the bottom, sloping to 18 inches on the top; wing walls to be well coped with stone, and the stone work to be erected on a solid foundation, sufficiently deep under ground to prevent frost and water from undermining or acting upon; abutments to be built of good stone, the large stone 3 feet of solid masonry below the water to be built without mortar, or what is termed a dry wall; above the three feet to be built with mortar, and the stone work all to be pointed in with three feet of the abutments 14 feet wide, or twelve feet in the clear; 11 feet on each abutment, 12 by 18 inches, to be confined at the upper end, but not less than 10 inches between the top of the abutments, with 12 feet on top of the abutments; 11 sleepers, 22 feet long, 8 by 12 inches thick; 2 sills, 10 by 12 inches, each 10 feet long, to be confined at the upper end, and to rest on a cap-sill 8 by 8 inches; sleepers to rest on a cap-sill in the middle of the longest span, and to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8 inches square, to be supported on two posts, 10 inches square, with 2 braces, 8 inches square, to rest on a mud sill 24 feet long, not less than 12 inches between the top of the posts, and to be supported on a ground sufficiently deep to prevent frost and water from undermining; the 2 upper sleepers to be confined to the sills with good iron bolts, and to be supported on a square, one to be confined at each corner of the bridge, with side-raising running the entire length of the wing walls, to be confined on 16 posts, 10 inches square, with 2 braces, 8
